Section 3a Input controls

As many of the touch phones we are targeting have on screen keyboards we can help the browser choose the right keyboard to display for the different part of our forms.

1) Open the empty template step3a.html
2) Add several html input tag to the body.
3) Experiment by changing the attribute type to text, tel, url, email, number, date, time, datetime, month, week, range, color, password.
4) Browse to your page on both Android and an iOS device click on your input and see what keyboard you are given.
5) Add a select box with multiple values.
6) Browse again and see how it renders differently dependent on device.
   Note even iPhone and iPad render form components differently.
7) Add some special links:
   ```
   <a href="mailto:username@server.com">Send email</a><br>
   <a href="tel:5555555555">Make Call</a><br>
   <a href="sms:6188888888">Send SMS</a><br>
   <a href="http://au.youtube.com/watch?v=w0ffwDYo00Q">Watch Video</a><br>
   <a href="http://maps.google.com/maps?sll=37.0625,-95.677068&sspn=43.983628,42.626953&z=3">View Map</a><br>
   ```
8) Test the links on the Android and iOS.
